1 Minimal Violation Matrices of Total Unimodularity

Definition 1. A minimal violation matrix of total unimodularity (a “minimal TU violating” matrix) is a matrix with entries in a commutative ring that is not TU, but whose every proper submatrix is TU.

Remark 1. Truemper’s definition is: a minimal violation matrix of total unimodularity is a $\{0, \pm 1\}$ matrix that is not TU but whose every proper submatrix is TU. The only difference between these two definitions is the case of 1×1 matrices, which can be minimal TU violating by our definition, but not by Truemper’s definition.

Lemma 1. *A minimal TU violating matrix is square.*

Proof. Suppose the matrix is not square. Then every square submatrix of it is proper and is TU by the definition of minimal TU violating matrices. But then the entire matrix is TU, which contradicts the definition. \square

Lemma 2. *A 2×2 minimal TU violating matrix consists of four ± 1 entries.*

Proof. If there is an entry not in $\{0, \pm 1\}$, then the 1×1 square submatrix consisting of that entry is not TU, which contradicts the definition of minimal TU violation matrices.

If there is a 0 entry, then the determinant of the entire matrix is in $\{0, \pm 1\}$. Indeed, in this case the determinant up to sign equals the product of the two entries in the diagonal not containing the 0 entry, and both of those entries are in $\{0, \pm 1\}$. Thus, the entire matrix is TU, which contradicts the definition of minimal TU violation matrices.

Thus, the matrix can only have ± 1 entries. \square

Lemma 3. *Let a minimal violation matrix have order $k \geq 3$. Suppose we perform a real pivot in that matrix, then delete the pivot row and column. Then the resulting matrix is smaller than the original matrix and is also minimal TU violating.*

Proof. The resulting matrix is smaller, since it has 1 fewer row and column than the original matrix.

Let A denote the original matrix, A' the matrix after the pivoting step, and A'' the final matrix after the pivot row and column are removed from A' .

Consider an arbitrary proper square submatrix B'' of A'' . Our goal is to show that B'' is TU. Consider the corresponding submatrix B of the original matrix (formed by the same choice of row and column indices). Append the pivoting row and column to B and call the resulting matrix C . Note that C is a proper submatrix of the original matrix (otherwise B'' contains all rows and columns of A'' and thus is not a proper submatrix of A''), so it is TU. Thus, after the pivoting step it is transformed into a TU matrix C' . Removing the pivoting row and column from C' gives the starting submatrix B'' and does not affect TUness. Thus, every square submatrix of A'' is TU.

It remains to show that A'' itself is not TU. Note that the entries of A'' can be expressed as $a_{ij} - \frac{a_{ic}a_{rj}}{a_{rc}}$ where i, j are row and column indices in A'' and r, c are the indices of the pivot row and column. Using the linearity of the determinant we can express the determinant of A'' as follows:

Note: The indices in the formula below are not 100% formally correct. The text explains the intent behind the formula, and the expression can be corrected accordingly. Refer to the “Modified Proof” section for a stricter phrasing of the same idea.

$$\det A'' = \det A' - \sum_{k=1}^n \frac{a_{rk}}{a_{rc}} \det [a_{.1} \mid \cdots \mid \hat{a}_{.k} \mid a_{.c} \mid \cdots \mid a_{.n}].$$

Here the last matrix on the right hand side is obtained from A'' by replacing the column $a_{.k}$ with the column $a_{.c}$. By the determinant expansion formula applied to the pivot row of A , the expression on the right-hand side of the formula above equals, up to sign, $\frac{1}{a_{rc}} \det A$. Since A is not TU, we have $\det A \notin \{0, \pm 1\}$. Since $a_{rc} \in \{\pm 1\}$, we get $\det A'' \notin \{0, \pm 1\}$, and hence A'' is also not TU. \square

Lemma 4. *A TU matrix does not contain a minimal TU violating matrix as a submatrix.*

Proof. A square submatrix of a TU matrix is TU, so it cannot be minimal TU violating, which is not TU. \square

Lemma 5. *A non-TU matrix contains a minimal TU violating matrix as a submatrix.*

Proof. Consider the following statement for every $k \in \mathbb{Z}_{\geq 1}$: the original matrix contains a square matrix of size k with determinant not in $\{0, \pm 1\}$. If this statement does not hold for any $k \in \mathbb{Z}_{\geq 1}$, then the original matrix is TU. Thus this statement does not hold for some k . Choose the smallest such k and consider the corresponding square submatrix. Note that it is minimal TU violating. Indeed, on the one hand, its determinant is not in $\{0, \pm 1\}$, so it is not TU. On the other hand, every its proper square submatrix is a square submatrix of the original matrix of size strictly less than k . Hence it has determinant in $\{0, \pm 1\}$ by the statement above. \square

2 Regularity of 2-Sum

Definition 2. Let B_1, B_2 be matrices with $\{0, \pm 1\}$ entries expressed as $B_1 = [A_1/x]$ and $B_2 = [y \mid A_2]$, where A_1, A_2 are matrices, x is a row vector, and y is a column vector. Let D be the outer product of column y and row x . The 2-sum of B_1 and B_2 is defined as

$$B_1 \oplus_{2,x,y} B_2 = \begin{bmatrix} A_1 & 0 \\ D & A_2 \end{bmatrix}.$$

Lemma 6. *Suppose that B_1 and B_2 are TU. Then $[A_1/D]$ and $[D \mid A_2]$ are also TU.*

Proof. Note that D can be viewed as a matrix consisting of 0 rows and copies of the rows x and $-x$. Since $B_1 = [A_1/x]$ is TU and since adding copies of a row multiplied by $0, \pm 1$ does not affect TUness, we conclude that $[A_1/D]$ is TU.

Similarly, D can be viewed as a matrix consisting of 0 columns and copies of the columns y and $-y$. Since $B_2 = [y \mid A_2]$ is TU and since adding copies of a column multiplied by $0, \pm 1$ does not affect TUness, we conclude that $[D \mid A_2]$ is TU. \square

Lemma 7. *Suppose that B_1 and B_2 are TU and let $B = B_1 \oplus_{2,x,y} B_2$. Then all entries in B are in $\{0, \pm 1\}$ and B does not contain a 2×2 minimal TU violating matrix.*

Proof. Note that B is a $\{0, \pm 1\}$ matrix by construction.

Suppose that B contains a 2×2 minimal TU violating matrix V . Note that V cannot be a submatrix of $[A_1/D]$, $[D \mid A_2]$, $[A_1 \mid 0]$, or $[0/A_2]$, as all of those four matrices are TU. Thus, V shares one row and one column index with A_1 and A_2 each. Let i be the row shared by V and A_1 and j be the column shared by V and A_2 . Note that the entry $V_{ij} = 0$. Thus, V cannot be a minimal TU violating matrix, since a 2×2 minimal TU violating matrix must have all four entries in ± 1 . \square

Lemma 8. *Suppose that B_1 and B_2 are TU and let $B = B_1 \oplus_{2,x,y} B_2$. Suppose that B contains a minimal TU violating matrix of size $k \geq 3$. Then there exist matrices \tilde{B}_1 and \tilde{B}_2 with the following properties:*

- \tilde{B}_1 and \tilde{B}_2 are the same size as B_1 and B_2 , respectively.
- \tilde{B}_1 and \tilde{B}_2 are TU.

- $\tilde{B}_1 \oplus_{2,\tilde{x},\tilde{y}} \tilde{B}_2$ contains a minimal TU violating matrix of size $k - 1$. Here \tilde{x} and \tilde{y} are the row and column of \tilde{B}_1 and \tilde{B}_2 with the same indices as x and y , respectively.

Proof. Note that V cannot be a submatrix of $[A_1/D]$, $[D \mid A_2]$, $[A_1 \mid 0]$, or $[0/A_2]$, as all of those four matrices are TU. Thus, V shares at least one row and one column index with A_1 and A_2 each.

Consider the row of V whose index appears in A_1 . Note that it cannot consist of only 0 entries, as otherwise V has determinant 0 and hence cannot be minimal TU violating. Therefore there exists a ± 1 entry shared by V and A_1 . Let r and c denote the row and column index of this entry, respectively.

Perform a rational pivot in B on the element B_{rc} . For every object, its modified counterpart after pivoting is denoted by the same symbol with an added tilde; for example, \tilde{B} denotes the entire matrix after the pivot. Note that after pivoting the following statements hold:

- $[\tilde{A}_1/\tilde{D}]$ is TU, since TUness is preserved by pivoting.
- $\tilde{A}_2 = A_2$, i.e., A_2 remains unchanged. This holds because of the 0 block in B .
- \tilde{D} consists of copies of a column of D scaled by factors in $\{0, \pm 1\}$. This can be verified by performing a case distinction and simple calculation.
- $[\tilde{D} \mid \tilde{A}_2]$ is TU, since this matrix consists of A_2 and copies of y scaled by factors $\{0, \pm 1\}$.
- \tilde{D} can be represented as an outer product of a column vector \tilde{y} and a row vector \tilde{x} , and we can define $\tilde{B}_1 = [\tilde{A}_1/\tilde{x}]$ and $\tilde{B}_2 = [\tilde{y} \mid \tilde{A}_2]$ similar to B_1 and B_2 , respectively. Note that \tilde{B}_1 and \tilde{B}_2 have the same size as B_1 and B_2 , respectively, are both TU, and satisfy $\tilde{B} = \tilde{B}_1 \oplus_{2,\tilde{x},\tilde{y}} \tilde{B}_2$.
- \tilde{B} contains a minimal violation matrix of size $k - 1$. This holds by Lemma 3.

To sum up, after pivoting we obtain a matrix \tilde{B} that represents a 2-sum of TU matrices \tilde{B}_1 and \tilde{B}_2 and contains a minimal TU violating matrix of size $k - 1$. Thus, all the desired properties are satisfied. \square

Lemma 9. Suppose that B_1 and B_2 are TU. Then $B_1 \oplus_{2,x,y} B_2$ is also TU.

Proof. Proof by induction.

Proposition for any $k \in \mathbb{Z}_{\geq 1}$: For any TU matrices B_1 and B_2 , their 2-sum $B_1 \oplus_{2,x,y} B_2$ does not contain a minimal TU violating matrix of size k .

Base: The Proposition holds for $k = 1$ and $k = 2$ by Lemma 7.

Step: Suppose the Proposition holds for some k . If it does not hold for $k + 1$, then by Lemma 8 there exist matrices B'_1 and B'_2 that are TU but whose 2-sum contains a minimal TU violating matrix of size k , which contradicts the induction hypothesis.

Conclusion: For any TU matrices B_1 and B_2 , their 2-sum $B_1 \oplus_{2,x,y} B_2$ does not contain a minimal TU violating matrix of any size $k \in \mathbb{Z}_{\geq 1}$. Thus, $B_1 \oplus_{2,x,y} B_2$ is TU. \square

3 Modified Proof of Regularity of 2-Sum

The goal of this section is to streamline the proof of regularity of 2-sum. To this end, rather than working with minimal violation matrices, we argue about determinants of submatrices, which avoids dealing with minimality. Additionally, the inductive proof is rephrased using positive statements, making it more direct.

Lemma 10. Let A be a $k \times k$ matrix. Let $r, c \in \{1, \dots, k\}$ be a row and column index, respectively, such that $a_{rc} \neq 0$. Let A' denote the matrix obtained from A by performing a real pivot on a_{rc} . Then there exists a $(k - 1) \times (k - 1)$ submatrix A'' of A' with $|\det A''| = \frac{|\det A|}{|a_{rc}|}$.

Proof. Let A'' be the submatrix of A' given by row index set $R = \{1, \dots, k\} \setminus \{r\}$ and column index set $C = \{1, \dots, k\} \setminus \{c\}$. By the explicit formula for pivoting in A on a_{rc} , the entries of A'' are given by $a''_{ij} = a_{ij} - \frac{a_{ic}a_{rj}}{a_{rc}}$. Using the linearity of the determinant, we can express $\det A''$ as

$$\det A'' = \det A' - \sum_{k \in C} \frac{a_{rk}}{a_{rc}} \det B''_k$$

where B_k'' is a matrix obtained from A'' by replacing column a_k'' with the pivot column a_{rc} without the pivot element a_{rc} .

By the cofactor expansion in A along row r , we have

$$\det A = \sum_{k=1}^n (-1)^{r+k} a_{rk} \det B_{r,k}$$

where $B_{r,k}$ is obtained from A by removing row r and column k . By swapping the order of columns in $B_{r,k}$ to match the form of B_k , we get

$$\det A = (-1)^{r+c} (a_{rc} \det A' - \sum_{k \in C} a_{rk} \det B_k'').$$

By combining the above results, we get $|\det A''| = \frac{|\det A|}{|a_{rc}|}$. \square

Corollary 1. Let A be a $k \times k$ matrix with $\det A \notin \{0, \pm 1\}$. Let $r, c \in \{1, \dots, k\}$ be a row and column index, respectively, and suppose that $a_{rc} \in \{\pm 1\}$. Let A' denote the matrix obtained from A by performing a real pivot on a_{rc} . Then there exists a $(k-1) \times (k-1)$ submatrix A'' of A' with $\det A'' \notin \{0, \pm 1\}$.

Proof. Since $a_{rc} \in \{\pm 1\}$, by Lemma 10 there exists a $(k-1) \times (k-1)$ submatrix A'' with $|\det A| = |\det A''|$. Since $\det A \notin \{0, \pm 1\}$, we have $\det A'' \notin \{0, \pm 1\}$. \square

Definition 3 (Repeats Definition 2). Let B_1, B_2 be matrices with $\{0, \pm 1\}$ entries expressed as $B_1 = [A_1/x]$ and $B_2 = [y \mid A_2]$, where x is a row vector, y is a column vector, and A_1, A_2 are matrices of appropriate dimensions. Let D be the outer product of y and x . The 2-sum of B_1 and B_2 is defined as

$$B_1 \oplus_{2,x,y} B_2 = \begin{bmatrix} A_1 & 0 \\ D & A_2 \end{bmatrix}.$$

Definition 4. Given $k \in \mathbb{Z}_{\geq 1}$, we say that a matrix A is k -TU if every square submatrix of A of size k has determinant in $\{0, \pm 1\}$.

Remark 2. Note that a matrix is TU if and only if it is k -TU for every $k \in \mathbb{Z}_{\geq 1}$.

Lemma 11. Let B_1 and B_2 be TU matrices and let $B = B_1 \oplus_{2,x,y} B_2$. Then B is 1-TU and 2-TU.

Proof. To see that B is 1-TU, note that B is a $\{0, \pm 1\}$ matrix by construction.

To show that B is 2-TU, let V be a 2×2 submatrix V of B . If V is a submatrix of $[A_1/D]$, $[D \mid A_2]$, $[A_1 \mid 0]$, or $[0/A_2]$, then $\det V \in \{0, \pm 1\}$, as all of those four matrices are TU. Otherwise V shares exactly one row and one column index with both A_1 and A_2 . Let i be the row shared by V and A_1 and j be the column shared by V and A_2 . Note that $V_{ij} = 0$. Thus, $\det V$ equals the product of the entries on the diagonal not containing V_{ij} . Since both of those entries are in $\{0, \pm 1\}$, we have $\det V \in \{0, \pm 1\}$. \square

Lemma 12. Let $k \in \mathbb{Z}_{\geq 1}$. Suppose that for any TU matrices B_1 and B_2 their 2-sum $B = B_1 \oplus_{2,x,y} B_2$ is ℓ -TU for every $\ell < k$. Then for any TU matrices B_1 and B_2 their 2-sum $B = B_1 \oplus_{2,x,y} B_2$ is also k -TU.

Proof. For the sake of deriving a contradiction, suppose there exist TU matrices B_1 and B_2 such that their 2-sum $B = B_1 \oplus_{2,x,y} B_2$ is not k -TU. Then B contains a $k \times k$ submatrix V with $\det V \notin \{0, \pm 1\}$.

Note that V cannot be a submatrix of $[A_1/D]$, $[D \mid A_2]$, $[A_1 \mid 0]$, or $[0/A_2]$, as all of those four matrices are TU. Thus, V shares at least one row and one column index with A_1 and A_2 each.

Consider the row of V whose index appears in A_1 . Note that it cannot consist of only 0 entries, as otherwise $\det V = 0$. Thus there exists a ± 1 entry shared by V and A_1 . Let r and c denote the row and column index of this entry, respectively.

Perform a rational pivot in B on the element B_{rc} . For every object, its modified counterpart after pivoting is denoted by the same symbol with an added tilde; for example, \tilde{B} denotes the entire matrix after the pivot. Note that after pivoting the following statements hold:

- $[\tilde{A}_1/\tilde{D}]$ is TU, since TUness is preserved by pivoting.

- $\tilde{A}_2 = A_2$, i.e., A_2 remains unchanged. This holds because of the 0 block in B .
- \tilde{D} consists of copies of y scaled by factors in $\{0, \pm 1\}$. This can be verified via a case distinction and a simple calculation.
- $\begin{bmatrix} \tilde{D} & \tilde{A}_2 \end{bmatrix}$ is TU, since this matrix consists of A_2 and copies of y scaled by factors $\{0, \pm 1\}$.
- \tilde{D} can be represented as an outer product of a column vector \tilde{y} and a row vector \tilde{x} , and we can define $\tilde{B}_1 = \begin{bmatrix} \tilde{A}_1 & \tilde{x} \end{bmatrix}$ and $\tilde{B}_2 = \begin{bmatrix} \tilde{y} & \tilde{A}_2 \end{bmatrix}$ similar to B_1 and B_2 , respectively. Note that \tilde{B}_1 and \tilde{B}_2 have the same size as B_1 and B_2 , respectively, are both TU, and satisfy $\tilde{B} = \tilde{B}_1 \oplus_{2, \tilde{x}, \tilde{y}} \tilde{B}_2$.
- \tilde{B} contains a square submatrix \tilde{V} of size $k-1$ with $\det \tilde{V} \notin \{0, \pm 1\}$. Indeed, by Corollary 1 from Lemma 10, pivoting in V on the element B_{rc} results in a matrix containing a $(k-1) \times (k-1)$ submatrix V'' with $\det V'' \in \{0, \pm 1\}$. Since V is a submatrix of B , the submatrix V'' corresponds to a submatrix \tilde{V} of \tilde{B} with the same property.

To sum up, after pivoting we obtain a matrix \tilde{B} that represents a 2-sum of TU matrices \tilde{B}_1 and \tilde{B}_2 and contains a square submatrix of size $k-1$ with determinant not in $\{0, \pm 1\}$. This is a contradiction with $(k-1)$ -TUness of \tilde{B} , which proves the lemma. \square

Lemma 13. *Let B_1 and B_2 be TU matrices. Then $B_1 \oplus_{2,x,y} B_2$ is also TU.*

Proof. Proof by induction.

Proposition for any $k \in \mathbb{Z}_{\geq 1}$: For any TU matrices B_1 and B_2 , their 2-sum $B = B_1 \oplus_{2,x,y} B_2$ is ℓ -TU for every $\ell \leq k$.

Base: The Proposition holds for $k = 1$ and $k = 2$ by Lemma 11.

Step: If the Proposition holds for some k , then it also holds for $k+1$ by Lemma 12.

Conclusion: For any TU matrices B_1 and B_2 , their 2-sum $B_1 \oplus_{2,x,y} B_2$ is k -TU for every $k \in \mathbb{Z}_{\geq 1}$. Thus, $B_1 \oplus_{2,x,y} B_2$ is TU. \square

4 Regularity of 3-Sum

Coming soon...
