# Regularity of 1-, 2-, and 3-Sums of Matroids

Ivan Sergeev

June 26, 2025

## **Preliminaries**

#### 1.1 Total Unimodularity

**Definition 1.** Matrix is a function that takes a row index and returns a vector, which is a function that takes a column index and returns a value. The former aforementioned identity is definitional, the latter is syntactical. By abuse of notation  $(R^Y)^X \equiv R^{X \times Y}$  we do not curry functions in this text. When a matrix happens to be finite (that is, both X and Y are finite) and its entries are numeric, we like to represent it by a table of numbers.

**Definition 2.** Let A be a square matrix over a commutative ring. Determinant of A is the sum over all permutations, sign of the permutation times the product of ... .

| complete | definition |

**Definition 3.** Let R be a commutative ring. We say that a matrix  $A \in R^{X \times Y}$  is totally unimodular, or TU for short, if for every  $k \in \mathbb{N}$ , every (not necessarily contiguous)  $k \times k$  submatrix T of A has  $\det T \in \{0, \pm 1\}$ .

**Lemma 4.** Let A be a TU matrix. Suppose rows of A are multiplied by  $\{0, \pm 1\}$  factors. Then the resulting matrix A' is also TU.

Proof. We prove that A' is TU by Definition 3. To this end, let T' be a square submatrix of A'. Our goal is to show that  $\det T' \in \{0, \pm 1\}$ . Let T be the submatrix of A that represents T' before pivoting. If some of the rows of T were multiplied by zeros, then T' contains zero rows, and hence  $\det T' = 0$ . Otherwise, T' was obtained from T by multiplying certain rows by -1. Since T' has finitely many rows, the number of such multiplications is also finite. Since multiplying a row by -1 results in the determinant getting multiplied by -1, we get  $\det T' = \pm \det T \in \{0, \pm 1\}$  as desired.

**Lemma 5.** Let A be a TU matrix. Suppose columns of A are multiplied by  $\{0, \pm 1\}$  factors. Then the resulting matrix A' is also TU.

*Proof.* Apply Lemma 4 to  $A^{\top}$ .

**Definition 6.** Given  $k \in \mathbb{N}$ , we say that a matrix A is k-partially unimodular, or k-PU for short, if every (not necessarily contiguous, not necessarily injective)  $k \times k$  submatrix T of A has  $\det T \in \{0, \pm 1\}$ .

**Lemma 7.** A matrix A is TU if and only if A is k-PU for every  $k \in \mathbb{N}$ .

*Proof.* This follows from Definitions 3 and 6.

**Definition 8.** Matrix made of 4 blocks (2x2).

#### 1.2 Pivoting

**Definition 9.** Let  $A \in \mathbb{R}^{X \times Y}$  be a matrix and let  $(x,y) \in X \times Y$  be such that  $A(x,y) \neq 0$ . A long tableau pivot in A on (x,y) is the operation that maps A to the matrix A' where

$$\forall i \in X, \ \forall j \in Y, \ A'(i,j) = \begin{cases} \frac{A(i,j)}{A(x,y)}, & \text{if } i = x, \\ A(i,j) - \frac{A(i,y) \cdot A(x,j)}{A(x,y)}, & \text{if } i \neq x. \end{cases}$$

**Lemma 10.** Let  $A \in \mathbb{Q}^{X \times Y}$  be a TU matrix and let  $(x, y) \in X \times Y$  be such that  $A(x, y) \neq 0$ . Then performing the long tableau pivot in A on (x, y) yields a TU matrix.

*Proof.* See implementation in Lean.

**Definition 11.** Let  $A \in R^{X \times Y}$  be a matrix and let  $(x, y) \in X \times Y$  be such that  $A(x, y) \neq 0$ . Perform the following sequence of operations.

- 1. Adjoin the identity matrix  $1 \in R^{X \times X}$  to A, resulting in the matrix  $B = \begin{bmatrix} 1 & A \end{bmatrix} \in R^{X \times (X \oplus Y)}$ .
- 2. Perform a long tableau pivot in B on (x, y), and let C denote the result.
- 3. Swap columns x and y in C, and let D be the resulting matrix.
- 4. Finally, remove columns indexed by X from D, and let A' be the resulting matrix.

A short tableau pivot in A on (x, y) is the operation that maps A to the matrix A' defined above.

**Lemma 12.** Let  $A \in R^{X \times Y}$  be a matrix and let  $(x, y) \in X \times Y$  be such that  $A(x, y) \neq 0$ . Then the short tableau pivot in A on (x, y) maps A to A' with

$$\forall i \in X, \ \forall j \in Y, \ A'(i,j) = \begin{cases} \frac{1}{A(x,y)}, & \text{if } i = x \text{ and } j = y, \\ \frac{A(x,j)}{A(x,y)}, & \text{if } i = x \text{ and } j \neq y, \\ -\frac{A(i,j)}{A(x,y)}, & \text{if } i \neq x \text{ and } j = y, \\ A(i,j) - \frac{A(i,y) \cdot A(x,j)}{A(x,y)}, & \text{if } i \neq x \text{ and } j \neq y. \end{cases}$$

*Proof.* Follows by direct calculation.

**Lemma 13.** Let  $B = \begin{bmatrix} B_{11} & 0 \\ B_{21} & B_{22} \end{bmatrix} \in \mathbb{Q}^{\{X_1 \cup X_2\} \times \{Y_1 \times Y_2\}}$ . Let  $B' = \begin{bmatrix} B'_{11} & B'_{12} \\ B'_{21} & B'_{22} \end{bmatrix}$  be the result of performing a short tableau pivot on  $(x,y) \in X_1 \times Y_1$  in B. Then  $B'_{12} = 0$ ,  $B'_{22} = B_{22}$ , and  $\begin{bmatrix} B'_{11} \\ B'_{21} \end{bmatrix}$  is the matrix resulting from performing a short tableau pivot on (x,y) in  $\begin{bmatrix} B_{11} \\ B_{21} \end{bmatrix}$ .

*Proof.* This follows by a direct calculation. Indeed, because of the 0 block in B,  $B_{12}$  and  $B_{22}$  remain unchanged, and since  $\begin{bmatrix} B_{11} \\ B_{21} \end{bmatrix}$  is a submatrix of B containing the pivot element, performing a short tableau pivot in it is equivalent to performing a short tableau pivot in B and then taking the corresponding submatrix

**Lemma 14.** Let  $k \in \mathbb{N}$ , let  $A \in \mathbb{Q}^{k \times k}$ , and let A' be the result of performing a short tableau pivot in A on (x,y) with  $x,y \in \{1,\ldots,k\}$  such that  $A(x,y) \neq 0$ . Then A' contains a submatrix A'' of size  $(k-1) \times (k-1)$  with  $|\det A''| = |\det A|/|A(x,y)|$ .

Proof. Let  $X = \{1, \ldots, k\} \setminus \{x\}$  and  $Y = \{1, \ldots, k\} \setminus \{y\}$ , and let A'' = A'(X, Y). Since A'' does not contain the pivot row or the pivot column,  $\forall (i, j) \in X \times Y$  we have  $A''(i, j) = A(i, j) - \frac{A(i, y) \cdot A(x, j)}{A(x, y)}$ . For  $\forall j \in Y$ , let  $B_j$  be the matrix obtained from A by removing row x and column j, and let  $B''_j$  be the matrix obtained from A'' by replacing column j with A(X, y) (i.e., the pivot column without the pivot element). The cofactor expansion along row x in A yields

$$\det A = \sum_{j=1}^{k} (-1)^{y+j} \cdot A(x,j) \cdot \det B_j.$$

By reordering columns of every  $B_j$  to match their order in  $B_j''$ , we get

$$\det A = (-1)^{x+y} \cdot \left( A(x,y) \cdot \det A' - \sum_{j \in Y} A(x,j) \cdot \det B''_j \right).$$

By linearity of the determinant applied to  $\det A''$ , we have

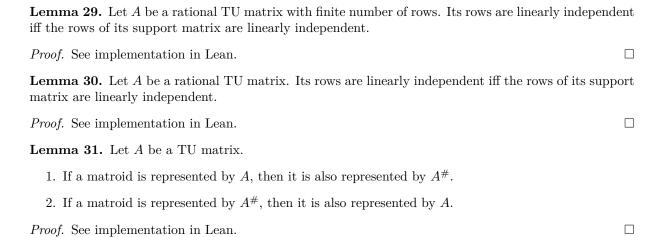

$$\det A'' = \det A' - \sum_{j \in Y} \frac{A(x,j)}{A(x,y)} \cdot \det B''_j$$

Therefore,  $|\det A''| = |\det A|/|A(x,y)|$ .

performing the short tableau pivot in A on (x, y) yields a TU matrix. *Proof.* See implementation in Lean. 1.3 Vector Matroids Definition 16. Add definition of matroids **Definition 17.** Let R be a division ring, let X and Y be sets, and let  $A \in \mathbb{R}^{X \times Y}$  be a matrix. The vector matroid of A is the matroid  $M = (Y, \mathcal{I})$  where a set  $I \subset Y$  is independent in M if and only if the columns of A indexed by I are linearly independent. **Definition 18.** Let R be a division ring, let X and Y be disjoint sets, and let  $S \in \mathbb{R}^{X \times Y}$  be a matrix. Let  $A = \begin{bmatrix} 1 & S \end{bmatrix} \in R^{X \times (X \cup Y)}$  be the matrix obtained from S by adjoining the identity matrix as columns, and let M be the vector matroid of A. Then S is called the standard representation of M. **Lemma 19.** Let  $S \in \mathbb{R}^{X \times Y}$  be a standard representation of a vector matroid M. Then X is a base in *Proof.* See implementation in Lean. Lemma 20. Adding extra zero rows to a full representation matrix of a vector matroid does not change the matroid. *Proof.* See implementation in Lean. **Lemma 21.** Let  $A \in \mathbb{Q}^{X \times Y}$  be a TU matrix, let M be the vector matroid of A, and let B be a base of M. Then there exists a matrix  $S \in \mathbb{Q}^{B \times (Y \setminus B)}$  such that S is TU and S is a standard representation of *Proof.* See implementation in Lean. **Definition 22.** Let R be a magma containing zero. The support of matrix  $A \in \mathbb{R}^{X \times Y}$  is  $A^{\#} \in \{0,1\}^{X \times Y}$ given by  $\forall i \in X, \ \forall j \in Y, \ A^{\#}(i,j) = \begin{cases} 0, & \text{if } A(i,j) = 0, \\ 1, & \text{if } A(i,j) \neq 0. \end{cases}$ **Lemma 23.** Transpose of a support matrix is equal to a support of the transposed matrix. *Proof.* Definitional equality. **Lemma 24.** Submatrix of a support matrix is equal to a support matrix of the submatrix. *Proof.* Definitional equality. **Lemma 25.** If A is a matrix over  $\mathbb{Z}_2$ , then  $A^{\#} = A$ . *Proof.* Check elementwise equality. Lemma 26. If two standard representation matrices of the same matroid have the same base, then they have the same support. *Proof.* See implementation in Lean. **Lemma 27.** A square matrix is invertible iff its determinant is invertible. *Proof.* This result is proved in Mathlib. П **Lemma 28.** Let A be a rational TU matrix with finite number of rows and finite number of columns. Its rows are linearly independent iff the rows of its support matrix are linearly independent.

**Lemma 15.** Let  $A \in \mathbb{Q}^{X \times Y}$  be a TU matrix and let  $(x,y) \in X \times Y$  be such that  $A(x,y) \neq 0$ . Then

*Proof.* See implementation in Lean.

#### 1.4 Regular Matroids

**Definition 32.** A matroid M is regular if there exists a TU matrix  $A \in \mathbb{Q}^{X \times Y}$  such that M is a vector matroid of A.

**Definition 33.** We say that  $A' \in \mathbb{Q}^{X \times Y}$  is a TU signing of  $A \in \mathbb{Z}_2^{X \times Y}$  if A' is TU and

$$\forall i \in X, \ \forall j \in Y, \ |A'(i,j)| = A(i,j).$$

**Lemma 34.** Let  $B \in \mathbb{Z}_2^{X \times Y}$  be a standard representation matrix of a matroid M. Then M is regular if and only if B has a TU signing.

*Proof.* Suppose that M is regular. By Definition 32, there exists a TU matrix  $A \in \mathbb{Q}^{X \times Y}$  such that M is a vector matroid of A. By Lemma 19, X (the row set of B) is a base of M. By Lemma 21, A can be converted into a standard representation matrix  $B' \in \mathbb{Q}^{X \times Y}$  of M such that B' is also TU. Since B' and B are both standard representations of M, by Lemma 26 the support matrices  $(B')^{\#}$  and  $B^{\#}$  are the same. Lemma 25 gives  $B^{\#} = B$ . Thus, B' is TU and  $(B')^{\#} = B$ , so B' is a TU signing of B.

Suppose that B has a TU signing  $B' \in \mathbb{Q}^{X \times Y}$ . Then  $A = [1 \mid B']$  is TU, as it is obtained from B' by adjoining the identity matrix. Moreover, by Lemma 31, A represents the same matroid as  $A^{\#} = [1 \mid B]$ , which is M. Thus, A is a TU matrix representing M, so M is regular.

# Regularity of 1-Sum

**Definition 35.** Let R be a magma containing zero (we will use  $R = \mathbb{Z}_2$  and  $R = \mathbb{Q}$ ). Let  $B_{\ell} \in R^{X_{\ell} \times Y_{\ell}}$  and  $B_r \in R^{X_r \times Y_r}$  be matrices where  $X_{\ell}, Y_{\ell}, X_r, Y_r$  are pairwise disjoint sets. The 1-sum  $B = B_{\ell} \oplus_1 B_r$  of  $B_{\ell}$  and  $B_r$  is

$$B = \begin{bmatrix} B_{\ell} & 0 \\ 0 & B_r \end{bmatrix} \in R^{(X_{\ell} \cup X_r) \times (Y_{\ell} \cup Y_r)}.$$

**Definition 36.** A matroid M is a 1-sum of matroids  $M_{\ell}$  and  $M_r$  if there exist standard  $\mathbb{Z}_2$  representation matrices  $B_{\ell}$ ,  $B_r$ , and B (for  $M_{\ell}$ ,  $M_r$ , and M, respectively) of the form given in Definition 35.

**Lemma 37.** Let A be a square matrix of the form  $A = \begin{bmatrix} A_{11} & A_{12} \\ 0 & A_{22} \end{bmatrix}$ . Then det  $A = \det A_{11} \cdot \det A_{22}$ .

*Proof.* This result is proved in Mathlib.

**Lemma 38.** Let  $B_{\ell}$  and  $B_r$  from Definition 35 be TU matrices (over  $\mathbb{Q}$ ). Then  $B = B_{\ell} \oplus_1 B_r$  is TU.

*Proof.* We prove that B is TU by Definition 3. To this end, let T be a square submatrix of B. Our goal is to show that  $\det T \in \{0, \pm 1\}$ .

Let  $T_{\ell}$  and  $T_r$  denote the submatrices in the intersection of T with  $B_{\ell}$  and  $B_r$ , respectively. Then T has the form

$$T = \begin{bmatrix} T_{\ell} & 0 \\ 0 & T_r \end{bmatrix}.$$

First, suppose that  $T_{\ell}$  and  $T_r$  are square. Then  $\det T = \det T_{\ell} \cdot \det T_r$  by Lemma 37. Moreover,  $\det T_{\ell}$ ,  $\det T_r \in \{0, \pm 1\}$ , since  $T_{\ell}$  and  $T_r$  are square submatrices of TU matrices  $B_{\ell}$  and  $B_r$ , respectively. Thus,  $\det T \in \{0, \pm 1\}$ , as desired.

Without loss of generality we may assume that  $T_{\ell}$  has fewer rows than columns. Otherwise we can transpose all matrices and use the same proof, since TUness and determinants are preserved under transposition. Thus, T can be represented in the form

$$T = \begin{bmatrix} T_{11} & T_{12} \\ 0 & T_{22} \end{bmatrix},$$

where  $T_{11}$  contains  $T_{\ell}$  and some zero rows,  $T_{22}$  is a submatrix of  $T_r$ , and  $T_{12}$  contains the rest of the rows of  $T_r$  (not contained in  $T_{22}$ ) and some zero rows. By Lemma 37, we have  $\det T = \det T_{11} \cdot \det T_{22}$ . Since  $T_{11}$  contains at least one zero row,  $\det T_{11} = 0$ . Thus,  $\det T = 0 \in \{0, \pm 1\}$ , as desired.

**Theorem 39.** Let M be a 1-sum of regular matroids  $M_{\ell}$  and  $M_{r}$ . Then M is also regular.

*Proof.* Let  $B_{\ell}$ ,  $B_r$ , and B be standard  $\mathbb{Z}_2$  representation matrices from Definition 36. Since  $M_{\ell}$  and  $M_r$  are regular, by Lemma 34,  $B_{\ell}$  and  $B_r$  have TU signings  $B'_{\ell}$  and  $B'_r$ , respectively. Then  $B' = B'_{\ell} \oplus_1 B'_r$  is a TU signing of B. Indeed, B' is TU by Lemma 38, and a direct calculation shows that B' is a signing of B. Thus, M is regular by Lemma 34.

# Regularity of 2-Sum

**Definition 40.** Let R be a semiring (we will use  $R = \mathbb{Z}_2$  and  $R = \mathbb{Q}$ ). Let  $B_{\ell} \in R^{X_{\ell} \times Y_{\ell}}$  and  $B_r \in R^{X_r \times Y_r}$  where  $X_{\ell} \cap X_r = \{x\}$ ,  $Y_{\ell} \cap Y_r = \{y\}$ ,  $X_{\ell}$  is disjoint with  $Y_{\ell}$  and  $Y_r$ , and  $X_r$  is disjoint with  $Y_{\ell}$  and  $Y_r$ . Additionally, let  $A_{\ell} = B_{\ell}(X_{\ell} \setminus \{x\}, Y_{\ell})$  and  $A_r = B_r(X_r, Y_r \setminus \{y\})$ , and suppose  $r = B_{\ell}(x, Y_{\ell}) \neq 0$  and  $c = B_r(X_r, y) \neq 0$ . Then the 2-sum  $B = B_{\ell} \oplus_{2,x,y} B_r$  of  $B_{\ell}$  and  $B_r$  is defined as

$$B = \begin{bmatrix} A_{\ell} & 0 \\ D & A_r \end{bmatrix} \quad \text{where} \quad D = c \otimes r.$$

Here  $D \in \mathbb{R}^{X_r \times Y_\ell}$ , and the indexing is consistent everywhere.

**Definition 41.** A matroid M is a 2-sum of matroids  $M_{\ell}$  and  $M_r$  if there exist standard  $\mathbb{Z}_2$  representation matrices  $B_{\ell}$ ,  $B_r$ , and B (for  $M_{\ell}$ ,  $M_r$ , and M, respectively) of the form given in Definition 40.

**Lemma 42.** Let  $B_{\ell}$  and  $B_r$  from Definition 40 be TU matrices (over  $\mathbb{Q}$ ). Then  $C = \begin{bmatrix} D & A_r \end{bmatrix}$  is TU.

*Proof.* Since  $B_{\ell}$  is TU, all its entries are in  $\{0, \pm 1\}$ . In particular, r is a  $\{0, \pm 1\}$  vector. Therefore, every column of D is a copy of y, -y, or the zero column. Thus, C can be obtained from  $B_r$  by adjoining zero columns, duplicating the y column, and multiplying some columns by -1. Since all these operations preserve TUess and since  $B_r$  is TU, C is also TU.

**Lemma 43.** Let  $B_{\ell}$  and  $B_r$  be matrices from Definition 40. Let  $B'_{\ell}$  and B' be the matrices obtained by performing a short tableau pivot on  $(x_{\ell}, y_{\ell}) \in X_{\ell} \times Y_{\ell}$  in  $B_{\ell}$  and B, respectively. Then  $B' = B'_{\ell} \oplus_{2,x,y} B_r$ .

Proof. Let

$$B'_{\ell} = \begin{bmatrix} A'_{\ell} \\ r' \end{bmatrix}, \quad B' = \begin{bmatrix} B'_{11} & B'_{12} \\ B'_{21} & B'_{22} \end{bmatrix}$$

where the blocks have the same dimensions as in  $B_{\ell}$  and B, respectively. By Lemma 13,  $B'_{11} = A'_{\ell}$ ,  $B'_{12} = 0$ , and  $B'_{22} = A_r$ . Equality  $B'_{21} = c \otimes r'$  can be verified via a direct calculation. Thus,  $B' = B'_{\ell} \oplus_{2,x,y} B_r$ .

**Lemma 44.** Let  $B_{\ell}$  and  $B_r$  from Definition 40 be TU matrices (over  $\mathbb{Q}$ ). Then  $B_{\ell} \oplus_{2,x,y} B_r$  is TU.

*Proof.* By Lemma 7, it suffices to show that  $B_{\ell} \oplus_{2,x,y} B_r$  is k-PU for every  $k \in \mathbb{N}$ . We prove this claim by induction on k. The base case with k = 1 holds, since all entries of  $B_{\ell} \oplus_{2,x,y} B_r$  are in  $\{0, \pm 1\}$  by construction

Suppose that for some  $k \in \mathbb{N}$  we know that for any TU matrices  $B'_{\ell}$  and  $B'_{r}$  (from Definition 40) their 2-sum  $B'_{\ell} \oplus_{2,x,y} B'_{r}$  is k-PU. Now, given TU matrices  $B_{\ell}$  and  $B_{r}$  (from Definition 40), our goal is to show that  $B = B_{\ell} \oplus_{2,x,y} B_{r}$  is (k+1)-PU, i.e., that every  $(k+1) \times (k+1)$  submatrix T of B has  $\det T \in \{0, \pm 1\}$ .

First, suppose that T has no rows in  $X_{\ell}$ . Then T is a submatrix of  $[D \ A_r]$ , which is TU by Lemma 42, so det  $T \in \{0, \pm 1\}$ . Thus, we may assume that T contains a row  $x_{\ell} \in X_{\ell}$ .

Next, note that without loss of generality we may assume that there exists  $y_{\ell} \in Y_{\ell}$  such that  $T(x_{\ell}, y_{\ell}) \neq 0$ . Indeed, if  $T(x_{\ell}, y) = 0$  for all y, then  $\det T = 0$  and we are done, and  $T(x_{\ell}, y) = 0$  holds whenever  $y \in Y_{r}$ .

Since B is 1-PU, all entries of T are in  $\{0,\pm 1\}$ , and hence  $T(x_{\ell},y_{\ell}) \in \{\pm 1\}$ . Thus, by Lemma 14, performing a short tableau pivot in T on  $(x_{\ell},y_{\ell})$  yields a matrix that contains a  $k \times k$  submatrix T''

such that  $|\det T| = |\det T''|$ . Since T is a submatrix of B, matrix T'' is a submatrix of the matrix B' resulting from performing a short tableau pivot in B on the same entry  $(x_\ell,y_\ell)$ . By Lemma 43, we have  $B' = B'_\ell \oplus_{2,x,y} B_r$  where  $B'_\ell$  is the result of performing a short tableau pivot in  $B_\ell$  on  $(x_\ell,y_\ell)$ . Since  $B_\ell$  is TU, by Lemma 15,  $B'_\ell$  is also TU. Thus, by the inductive hypothesis applied to T'' and  $B'_\ell \oplus_{2,x,y} B_r$ , we have  $\det T'' \in \{0,\pm 1\}$ . Since  $|\det T| = |\det T''|$ , we conclude that  $\det T \in \{0,\pm 1\}$ .

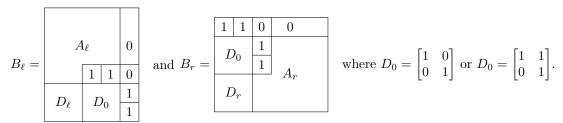

**Theorem 45.** Let M be a 2-sum of regular matroids  $M_{\ell}$  and  $M_{r}$ . Then M is also regular.

*Proof.* Let  $B_{\ell}$ ,  $B_r$ , and B be standard  $\mathbb{Z}_2$  representation matrices from Definition 41. Since  $M_{\ell}$  and  $M_r$  are regular, by Lemma 34,  $B_{\ell}$  and  $B_r$  have TU signings  $B'_{\ell}$  and  $B'_r$ , respectively. Then  $B' = B'_{\ell} \oplus_{2,x,y} B'_r$  is a TU signing of B. Indeed, B' is TU by Lemma 44, and a direct calculation verifies that B' is a signing of B. Thus, M is regular by Lemma 34.

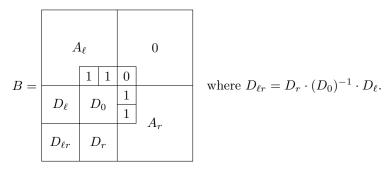

# Regularity of 3-Sum

#### 4.1 Definition

**Definition 46.** Let  $B_{\ell} \in \mathbb{Z}_2^{(X_{\ell} \cup \{x_0, x_1\}) \times (Y_{\ell} \cup \{y_2\})}, B_r \in \mathbb{Z}_2^{(X_r \cup \{x_2\}) \times (Y_r \cup \{y_0, y_1\})}$  be matrices of the form

The 3-sum  $B = B_{\ell} \oplus_3 B_r \in \mathbb{Z}_2^{(X_{\ell} \cup X_r) \times (Y_{\ell} \cup Y_r)}$  of  $B_{\ell}$  and  $B_r$  is defined as

Here  $x_2 \in X_{\ell}, x_0, x_1 \in X_r, y_0, y_1 \in Y_{\ell}, y_2 \in Y_r, A_{\ell} \in \mathbb{Z}_2^{X_{\ell} \times Y_{\ell}}, A_r \in \mathbb{Z}_2^{X_r \times Y_r}, D_{\ell} \in \mathbb{Z}_2^{\{x_0, x_1\} \times \{Y_{\ell} \setminus \{y_0, y_1\}\}}, D_r \in \mathbb{Z}_2^{\{x_0, x_1\} \times \{y_0, y_1\}}, D_{\ell r} \in \mathbb{Z}_2^{(X_r \setminus \{x_0, x_1\}) \times (Y_{\ell} \setminus \{y_0, y_1\})}, D_0 \in \mathbb{Z}_2^{\{x_0, x_1\} \times \{y_0, y_1\}}.$  The indexing is consistent everywhere.

Note that  $D_0$  is non-singular by construction, so  $D_{\ell r}$  and B are well-defined. Moreover, a non-singular  $\mathbb{Z}_2^{2\times 2}$  matrix is either  $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$  or  $\begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$  up to re-indexing. Thus, Definition 46 can be equivalently restated with  $D_0$  required to be non-singular and  $B_{\ell}$ ,  $B_r$ , and B re-indexed appropriately.

**Definition 47.** A matroid M is a 3-sum of matroids  $M_{\ell}$  and  $M_r$  if there exist standard  $\mathbb{Z}_2$  representation matrices  $B_{\ell}$ ,  $B_r$ , and B (for  $M_{\ell}$ ,  $M_r$ , and M, respectively) of the form given in Definition 46.

### 4.2 Canonical Signing

**Definition 48.** We call  $D_0' \in \mathbb{Q}^{\{x_0,x_1\} \times \{y_0,y_1\}}$  the canonical signing of  $D_0 \in \mathbb{Z}_2^{\{x_0,x_1\} \times \{y_0,y_1\}}$  if

$$D_0 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad \text{and} \quad D_0' = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}, \quad \text{or} \quad D_0 = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} \quad \text{and} \quad D_0' = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}.$$

Similarly, we call  $S' \in \mathbb{Q}^{\{x_0, x_1, x_2\} \times \{y_0, y_1, y_2\}}$  the canonical signing of  $S \in \mathbb{Z}_2^{\{x_0, x_1, x_2\} \times \{y_0, y_1, y_2\}}$  if

$$S = \begin{bmatrix} 1 & 1 & 0 \\ D_0 & 1 \\ \hline 1 \end{bmatrix} \text{ and } S' = \begin{bmatrix} 1 & 1 & 0 \\ D'_0 & 1 \\ \hline 1 \end{bmatrix}$$

To simplify notation, going forward we use  $D_0$ ,  $D'_0$ , S, and S' to refer to the matrices of the form above. BTW, the canonical signing S' of S (from Definition 48) is TU.

**Lemma 49.** Let Q be a TU signing of S (from Definition 48). Let  $u \in \{0, \pm 1\}^{\{x_0, x_1, x_2\}}, v \in \{0, \pm 1\}^{\{y_0, y_1, y_2\}},$  and Q' be defined as follows:

$$u(i) = \begin{cases} Q(x_2, y_0) \cdot Q(x_0, y_0), & i = x_0, \\ Q(x_2, y_0) \cdot Q(x_0, y_0) \cdot Q(x_0, y_2) \cdot Q(x_1, y_2), & i = x_1, \\ 1, & i = x_2, \end{cases}$$

$$v(j) = \begin{cases} Q(x_2, y_0), & j = y_0, \\ Q(x_2, y_1), & j = y_1, \\ Q(x_2, y_0) \cdot Q(x_0, y_0) \cdot Q(x_0, y_2), & j = y_2, \end{cases}$$

$$v'(i, j) = Q(i, j) \cdot u(i) \cdot v(j) \quad \forall i \in \{x_0, x_1, x_2\}, \ \forall j \in \{y_0, y_1, y_2\}.$$

Then Q' = S' (from Definition 48).

*Proof.* Since Q is a TU signing of S and Q' is obtained from Q by multiplying rows and columns by  $\pm 1$  factors, Q' is also a TU signing of S. By construction, we have

$$\begin{aligned} Q'(x_2,y_0) &= Q(x_2,y_0) \cdot 1 \cdot Q(x_2,y_0) = 1, \\ Q'(x_2,y_1) &= Q(x_2,y_1) \cdot 1 \cdot Q(x_2,y_1) = 1, \\ Q'(x_2,y_2) &= 0, \\ Q'(x_0,y_0) &= Q(x_0,y_0) \cdot (Q(x_2,y_0) \cdot Q(x_0,y_0)) \cdot Q(x_2,y_0) = 1, \\ Q'(x_0,y_1) &= Q(x_0,y_1) \cdot (Q(x_2,y_0) \cdot Q(x_0,y_0)) \cdot Q(x_2,y_1), \\ Q'(x_0,y_2) &= Q(x_0,y_2) \cdot (Q(x_2,y_0) \cdot Q(x_0,y_0)) \cdot (Q(x_2,y_0) \cdot Q(x_0,y_0) \cdot Q(x_0,y_2)) = 1, \\ Q'(x_1,y_0) &= 0, \\ Q'(x_1,y_1) &= Q(x_1,y_1) \cdot (Q(x_2,y_0) \cdot Q(x_0,y_0) \cdot Q(x_0,y_2) \cdot Q(x_1,y_2)) \cdot (Q(x_2,y_0) \cdot Q(x_0,y_2)) = 1. \end{aligned}$$

Thus, it remains to show that  $Q'(x_0, y_1) = S'(x_0, y_1)$  and  $Q'(x_1, y_1) = S'(x_1, y_1)$ .

Consider the entry  $Q'(x_0, y_1)$ . If  $D_0(x_0, y_1) = 0$ , then  $Q'(x_0, y_1) = 0 = S'(x_0, y_1)$ . Otherwise, we have  $D_0(x_0, y_1) = 1$ , and so  $Q'(x_0, y_1) \in \{\pm 1\}$ , as Q' is a signing of S. If  $Q'(x_0, y_1) = -1$ , then

$$\det Q'(\{x_0, x_2\}, \{y_0, y_1\}) = \det \begin{bmatrix} 1 & -1 \\ 1 & 1 \end{bmatrix} = 2 \notin \{0, \pm 1\},$$

which contradicts TUness of Q'. Thus,  $Q'(x_0, y_1) = 1 = S'(x_0, y_1)$ .

Consider the entry  $Q'(x_1, y_1)$ . Since Q' is a signing of S, we have  $Q'(x_1, y_1) \in \{\pm 1\}$ . Consider two cases.

- 1. Suppose that  $D_0 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ . If  $Q'(x_1, y_1) = 1$ , then  $\det Q = \det \begin{bmatrix} 1 & 1 & 0 \\ 1 & 0 & 1 \\ 0 & 1 & 1 \end{bmatrix} = -2 \notin \{0, \pm 1\}$ , which contradicts TUness of Q'. Thus,  $Q'(x_1, y_1) = -1 = S'(x_1, y_1)$ .
- 2. Suppose that  $D_0 = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ . If  $Q'(x_1, y_1) = -1$ , then  $\det Q(\{x_0, x_1\}, \{y_1, y_2\}) = \det \begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} = 2 \notin \{0, \pm 1\}$ , which contradicts TUness of Q'. Thus,  $Q'(x_1, y_1) = 1 = S'(x_1, y_1)$ .

**Definition 50.** Let X and Y be sets with  $\{x_0, x_1, x_2\} \subseteq X$  and  $\{y_0, y_1, y_2\} \subseteq Y$ . Let  $Q \in \mathbb{Q}^{X \times Y}$  be a TU matrix. Define  $u \in \{0, \pm 1\}^X$ ,  $v \in \{0, \pm 1\}^Y$ , and Q' as follows:

$$u(i) = \begin{cases} Q(x_2, y_0) \cdot Q(x_0, y_0), & i = x_0, \\ Q(x_2, y_0) \cdot Q(x_0, y_0) \cdot Q(x_0, y_2) \cdot Q(x_1, y_2), & i = x_1, \\ 1, & i = x_2, \\ 1, & i \in X \setminus \{x_0, x_1, x_2\}, \end{cases}$$

$$v(j) = \begin{cases} Q(x_2, y_0), & j = y_0, \\ Q(x_2, y_1), & j = y_1, \\ Q(x_2, y_0) \cdot Q(x_0, y_0) \cdot Q(x_0, y_2), & j = y_2, \\ 1, & j \in Y \setminus \{y_0, y_1, y_2\}, \end{cases}$$

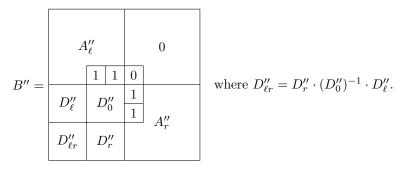

$$v(i, j) = Q(i, j) \cdot y(j) \cdot v(j) \quad \forall i \in X \quad \forall j \in Y$$

We call Q' the canonical re-signing of Q.

**Lemma 51.** Let X and Y be sets with  $\{x_0, x_1, x_2\} \subseteq X$  and  $\{y_0, y_1, y_2\} \subseteq Y$ . Let  $Q \in \mathbb{Q}^{X \times Y}$  be a TU signing of  $Q_0 \in \mathbb{Z}_2^{X \times Y}$  such that  $Q_0(\{x_0, x_1, x_2\}, \{y_0, y_1, y_2\}) = S$  (from Definition 48). Then the canonical re-signing Q' of Q (from Definition 50) is a TU signing of  $Q_0$  and  $Q'(\{x_0, x_1, x_2\}, \{y_0, y_1, y_2\}) = S'$  (from Definition 48).

*Proof.* Since Q is a TU signing of  $Q_0$  and Q' is obtained from Q by multiplying some rows and columns by  $\pm 1$  factors, Q' is also a TU signing of  $Q_0$ . Equality  $Q'(\{x_0, x_1, x_2\}, \{y_0, y_1, y_2\}) = S'$  follows from Lemma 49.

**Definition 52.** Suppose that  $B_{\ell}$  and  $B_r$  from Definition 46 have TU signings  $B'_{\ell}$  and  $B'_{r}$ , respectively. Let  $B''_{\ell}$  and  $B''_{r}$  be the canonical re-signings (from Definition 50) of  $B'_{\ell}$  and  $B'_{r}$ , respectively. Let  $A''_{\ell}$ ,  $A''_{r}$ ,  $D''_{\ell}$ ,  $D''_{r}$ , and  $D''_{0}$  be blocks of  $B''_{\ell}$  and  $B''_{r}$  analogous to blocks  $A_{\ell}$ ,  $A_{r}$ ,  $D_{\ell}$ ,  $D_{r}$ , and  $D_{0}$  of  $B_{\ell}$  and  $B_{r}$ . The canonical signing B'' of B is defined as

Note that  $D_0''$  is non-singular by construction, so  $D_{\ell r}''$  and hence B'' are well-defined.

### 4.3 Properties of Canonical Signing

**Lemma 53.** B'' from Definition 52 is a signing of B.

*Proof.* By Lemma 51,  $B''_{\ell}$  and  $B''_{r}$  are TU signings of  $B_{\ell}$  and  $B_{r}$ , respectively. As a result, blocks  $A''_{\ell}$ ,  $A''_{r}$ ,  $D''_{\ell}$ ,  $D''_{r}$ , and  $D''_{0}$  in B'' are signings of the corresponding blocks in B. Thus, it remains to show that  $D''_{\ell r}$  is a signing of  $D_{\ell r}$ . This can be verified via a direct calculation.

Need details?

**Lemma 54.** Suppose that  $B_r$  from Definition 46 has a TU signing  $B'_r$ . Let  $B''_r$  be the canonical re-signing (from Definition 50) of  $B'_r$ . Let  $c''_0 = B''_r(X_r, y_0)$ ,  $c''_1 = B''_r(X_r, y_1)$ , and  $c''_2 = c''_0 - c''_1$ . Then the following statements hold.

- 1. For every  $i \in X_r$ ,  $\begin{bmatrix} c_0''(i) & c_1''(i) \end{bmatrix} \in \{0, \pm 1\}^{\{y_0, y_1\}} \setminus \{ \begin{bmatrix} 1 & -1 \end{bmatrix}, \begin{bmatrix} -1 & 1 \end{bmatrix} \}$ .
- 2. For every  $i \in X_r$ ,  $c_2''(i) \in \{0, \pm 1\}$ .
- 3.  $\begin{bmatrix} c_0'' & c_2'' & A_r'' \end{bmatrix}$  is TU.

- 4.  $[c_1'' \quad c_2'' \quad A_r'']$  is TU.
- 5.  $\begin{bmatrix} c_0'' & c_1'' & c_2'' & A_r'' \end{bmatrix}$  is TU.

*Proof.* Throughout the proof we use that  $B''_r$  is TU, which holds by Lemma 51.

1. Since  $B_r''$  is TU, all its entries are in  $\{0, \pm 1\}$ , and in particular  $[c_0''(i) \ c_1''(i)] \in \{0, \pm 1\}^{\{y_0, y_1\}}$ . If  $[c_0'(i) \ c_1''(i)] = [1 \ -1]$ , then

$$\det B_r''(\{x_2, i\}, \{y_0, y_1\}) = \det \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} = -2 \notin \{0, \pm 1\},$$

which contradicts TUness of  $B_r''$ . Similarly, if  $\begin{bmatrix} c_0''(i) & c_1''(i) \end{bmatrix} = \begin{bmatrix} -1 & 1 \end{bmatrix}$ , then

$$\det B_r''(\{x_2, i\}, \{y_0, y_1\}) = \det \begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} = 2 \notin \{0, \pm 1\},$$

which contradicts TUness of  $B''_r$ . Thus, the desired statement holds.

- 2. Follows from item  ${\bf 1}$  and a direct calculation.
- 3. Performing a short tableau pivot in  $B''_r$  on  $(x_2, y_0)$  yields:

$$B_r'' = \begin{bmatrix} \boxed{1} & 1 & 0 \\ c_0 & c_1 & A_r \end{bmatrix} \quad \rightarrow \quad \begin{bmatrix} 1 & 1 & 0 \\ -c_0 & c_1'' - c_0 & A_r \end{bmatrix}$$

The resulting matrix can be transformed into  $\begin{bmatrix} c_0'' & c_2'' & A_r'' \end{bmatrix}$  by removing row  $x_2$  and multiplying columns  $y_0$  and  $y_1$  by -1. Since  $B_r''$  is TU and since TUness is preserved under pivoting, taking submatrices, multiplying columns by  $\pm 1$  factors, we conclude that  $\begin{bmatrix} c_0'' & c_2'' & A_r'' \end{bmatrix}$  is TU.

4. Similar to item 4, performing a short tableau pivot in  $B''_r$  on  $(x_2, y_1)$  yields:

$$B_r'' = \begin{bmatrix} 1 & \boxed{1} & 0 \\ c_0 & c_1 & A_r \end{bmatrix} \quad \rightarrow \quad \begin{bmatrix} 1 & 1 & 0 \\ c_0'' - c_1 & -c_1 & A_r \end{bmatrix}$$

The resulting matrix can be transformed into  $\begin{bmatrix} c_1'' & c_2'' & A_r'' \end{bmatrix}$  by removing row  $x_2$ , multiplying column  $y_1$  by -1, and swapping the order of columns  $y_0$  and  $y_1$ . Since  $B_r''$  is TU and since TUness is preserved under pivoting, taking submatrices, multiplying columns by  $\pm 1$  factors, and re-ordering columns, we conclude that  $\begin{bmatrix} c_1'' & c_2'' & A_r'' \end{bmatrix}$  is TU.

5. Let V be a square submatrix of  $\begin{bmatrix} c_0'' & c_1'' & c_2'' & A_r'' \end{bmatrix}$ . Our goal is to show that  $\det V \in \{0, \pm 1\}$ . Suppose that column  $c_2''$  is not in V. Then V is a submatrix of  $B_r''$ , which is TU. Thus,  $\det V \in \{0, \pm 1\}$ . Going forward we assume that column z is in V.

Suppose that columns  $c_0''$  and  $c_1''$  are both in V. Then V contains columns  $c_0''$ ,  $c_1''$ , and  $c_2'' = c_0'' - c_1''$ , which are linearly. Thus,  $\det V = 0$ . Going forward we assume that at least one of the columns  $c_0''$  and  $c_1''$  is not in V.

Suppose that column  $c_1''$  is not in V. Then V is a submatrix of  $\begin{bmatrix} c_0'' & c_2'' & A_r'' \end{bmatrix}$ , which is TU by item 3. Thus,  $\det V \in \{0, \pm 1\}$ . Similarly, if column  $c_0''$  is not in V, then V is a submatrix of  $\begin{bmatrix} c_1'' & c_2'' & A_r'' \end{bmatrix}$ , which is TU by item 4. Thus,  $\det V \in \{0, \pm 1\}$ .

**Lemma 55.** Suppose that  $B_{\ell}$  from Definition 46 has a TU signing  $B'_{\ell}$ . Let  $B''_{\ell}$  be the canonical re-signing (from Definition 50) of  $B'_{\ell}$ . Let  $d''_0 = B''_{\ell}(x_0, Y_{\ell})$ ,  $d''_1 = B''_{\ell}(x_1, Y_{\ell})$ , and  $d''_2 = d''_0 - d''_1$ . Then the following statements hold.

- 1. For every  $j \in Y_{\ell}$ ,  $\begin{bmatrix} d_0''(i) \\ d_1''(j) \end{bmatrix} \in \{0, \pm 1\}^{\{x_0, x_1\}} \setminus \left\{ \begin{bmatrix} 1 \\ -1 \end{bmatrix}, \begin{bmatrix} -1 \\ 1 \end{bmatrix} \right\}$ .
- 2. For every  $j \in Y_{\ell}$ ,  $d_2''(j) \in \{0, \pm 1\}$ .

3. 
$$\begin{bmatrix} A''_{\ell} \\ d''_{0} \\ d''_{2} \end{bmatrix}$$
 is TU.

4. 
$$\begin{bmatrix} A''_{\ell} \\ d''_{1} \\ d''_{2} \end{bmatrix}$$
 is TU.

5. 
$$\begin{bmatrix} A_{\ell}^{\prime\prime} \\ d_{0}^{\prime\prime} \\ d_{1}^{\prime\prime} \\ d_{2}^{\prime\prime} \end{bmatrix}$$
 is TU.

*Proof.* Apply Lemma 54 to  $B_{\ell}^{\top}$ , or repeat the same arguments up to transposition.

**Lemma 56.** Let B'' be from Definition 52. Let  $c_0'' = B''(X_r, y_0)$ ,  $c_1'' = B''(X_r, y_1)$ , and  $c_2'' = c_0'' - c_1''$ . Similarly, let  $d_0'' = B''(x_0, Y_\ell)$ ,  $d_1'' = B''(x_1, Y_\ell)$ , and  $d_2'' = d_0'' - d_1''$ . Then the following statements hold.

1. For every  $i \in X_r$ ,  $c_2''(i) \in \{0, \pm 1\}$ .

$$2. \text{ If } D_0'' = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}, \text{ then } D'' = c_0'' \otimes d_0'' - c_1'' \otimes d_1''. \text{ If } D_0'' = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}, \text{ then } D'' = c_0'' \otimes d_0'' - c_0'' \otimes d_1'' + c_1'' \otimes d_1''.$$

- 3. For every  $j \in Y_{\ell}$ ,  $D''(X_r, j) \in \{0, \pm c_0'', \pm c_1'', \pm c_2''\}$
- 4. For every  $i \in X_r$ ,  $D''(i, Y_\ell) \in \{0, \pm d_0'', \pm d_1'', \pm d_2''\}$
- 5.  $\begin{bmatrix} A''_{\ell} \\ D'' \end{bmatrix}$  is TU.

Proof.

- 1. Holds by Lemma 54.2.
- 2. Note that

$$\begin{bmatrix} D_\ell'' \\ D_{\ell''}'' \end{bmatrix} = \begin{bmatrix} D_0'' \\ D_r'' \end{bmatrix} \cdot (D_0'')^{-1} \cdot D_\ell'', \quad \begin{bmatrix} D_0'' \\ D_r'' \end{bmatrix} = \begin{bmatrix} D_0'' \\ D_r'' \end{bmatrix} \cdot (D_0'')^{-1} \cdot D_0'', \quad \begin{bmatrix} D_0'' \\ D_r'' \end{bmatrix} = \begin{bmatrix} c_0'' & c_1'' \end{bmatrix}, \quad \begin{bmatrix} D_\ell'' & D_0'' \end{bmatrix} = \begin{bmatrix} d_0'' \\ d_1'' \end{bmatrix}.$$

Thus.

$$D'' = \begin{bmatrix} D''_{\ell} & D''_{0} \\ D''_{\ell r} & D''_{r} \end{bmatrix} = \begin{bmatrix} D''_{0} \\ D''_{r} \end{bmatrix} \cdot (D''_{0})^{-1} \cdot \begin{bmatrix} D''_{\ell} & D''_{0} \end{bmatrix} = \begin{bmatrix} c''_{0} & c''_{1} \end{bmatrix} \cdot (D''_{0})^{-1} \cdot \begin{bmatrix} d''_{0} \\ d''_{1} \end{bmatrix}.$$

Considering the two cases for  $D_0''$  and performing the calculations yields the desired results.

- 3. Let  $j \in Y_{\ell}$ . By Lemma 55.1,  $\begin{bmatrix} d_0''(i) \\ d_1''(j) \end{bmatrix} \in \{0, \pm 1\}^{\{x_0, x_1\}} \setminus \left\{ \begin{bmatrix} 1 \\ -1 \end{bmatrix}, \begin{bmatrix} -1 \\ 1 \end{bmatrix} \right\}$ . Consider two cases.
  - (a) If  $D_0'' = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$ , then by item 2 we have  $D''(X_r, j) = d_0''(j) \cdot c_0'' + (-d_1''(j)) \cdot c_1''$ . By considering all possible cases for  $d_0''(j)$  and  $d_1''(j)$ , we conclude that  $D''(X_r, j) \in \{0, \pm c_0'', \pm c_1'', \pm (c_0'' c_1'')\}$ .
  - (b) If  $D_0'' = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ , then by item 2 we have  $D''(X_r, j) = (d_0''(j) d_1''(j)) \cdot c_0'' + d_1''(j) \cdot c_1''$ . By considering all possible cases for  $d_0''(j)$  and  $d_1''(j)$ , we conclude that  $D''(X_r, j) \in \{0, \pm c_0'', \pm c_1'', \pm (c_0'' c_1'')\}$ .
- 4. Let  $i \in X_r$ . By Lemma 54.1,  $\begin{bmatrix} c_0''(i) & c_1''(i) \end{bmatrix} \in \{0, \pm 1\}^{\{y_0, y_1\}} \setminus \{\begin{bmatrix} 1 & -1 \end{bmatrix}, \begin{bmatrix} -1 & 1 \end{bmatrix}\}$ . Consider two cases
  - (a) If  $D_0'' = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$ , then by item 2 we have  $D''(i, Y_\ell) = c_0''(i) \cdot d_0'' + (-c_1''(i)) \cdot d_1''$ . By considering all possible cases for  $c_0''(i)$  and  $c_1''(i)$ , we conclude that  $D''(i, Y_\ell) \in \{0, \pm d_0'', \pm d_1'', \pm d_2''\}$ .
  - (b) If  $D_0'' = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ , then by item 2 we have  $D''(i, Y_\ell) = c_0''(i) \cdot d_0'' + (c_1''(i) c_0''(i)) \cdot d_1''$ . By considering all possible cases for  $c_0''(i)$  and  $c_1''(i)$ , we conclude that  $D''(i, Y_\ell) \in \{0, \pm d_0'', \pm d_1'', \pm d_2''\}$ .

5. By Lemma 55.5, 
$$\begin{bmatrix} A_\ell'' \\ d_0'' \\ d_1'' \\ d_2'' \end{bmatrix}$$
 is TU. Since TUness is preserved under adjoining zero rows, copies of existing

rows, and multiplying rows by 
$$\pm 1$$
 factors, 
$$\begin{bmatrix} A''_\ell \\ 0 \\ \pm d''_0 \\ \pm d''_1 \\ \pm d''_2 \end{bmatrix}$$
 is also TU. By item 4, 
$$\begin{bmatrix} A''_\ell \\ D'' \end{bmatrix}$$
 is a submatrix of

the latter matrix, hence it is also TU.

#### 4.4 Proof of Regularity

**Definition 57.** Let  $X_{\ell}$ ,  $Y_{\ell}$ ,  $X_r$ ,  $Y_r$  be sets and let  $c_0, c_1 \in \mathbb{Q}^{X_r}$  be column vectors such that for every  $i \in X_r$  we have  $c_0(i)$ ,  $c_1(i)$ ,  $c_0(i) - c_1(i) \in \{0, \pm 1\}$ . Define  $\mathcal{C}(X_{\ell}, Y_{\ell}, X_r, Y_r; c_0, c_1)$  to be the family of matrices of the form  $\begin{bmatrix} A_{\ell} & 0 \\ D & A_r \end{bmatrix}$  where  $A_{\ell} \in \mathbb{Q}^{X_{\ell} \times Y_{\ell}}$ ,  $A_r \in \mathbb{Q}^{X_r \times Y_r}$ , and  $D \in \mathbb{Q}^{X_r \times Y_{\ell}}$  are such that:

- 1. for every  $j \in Y_{\ell}$ ,  $D(X_r, j) \in \{0, \pm c_0, \pm c_1, \pm (c_0 c_1)\}$ ,
- 2.  $\begin{bmatrix} c_0 & c_1 & c_0 c_1 & A_r \end{bmatrix}$  is TU,
- 3.  $\begin{bmatrix} A_{\ell} \\ D \end{bmatrix}$  is TU.

**Lemma 58.** Let B'' be from Definition 52. Then  $B'' \in \mathcal{C}(X_{\ell}, Y_{\ell}, X_r, Y_r; c_0'', c_1'')$  where  $c_0'' = B''(X_r, y_0)$  and  $c_1'' = B''(X_r, y_1)$ .

*Proof.* Recall that  $c_0'' - c_1'' \in \{0, \pm 1\}^{X_r}$  by Lemma 56.1, so  $\mathcal{C}(X_\ell, Y_\ell, X_r, Y_r; c_0'', c_1'')$  is well-defined. To see that  $B'' \in \mathcal{C}(X_\ell, Y_\ell, X_r, Y_r; c_0'', c_1'')$ , note that all properties from Definition 57 are satisfied: property 1 holds by Lemma 56.3, property 2 holds by Lemma 54.5, and property 3 holds by Lemma 56.5.

**Lemma 59.** Let  $C \in \mathcal{C}(X_{\ell}, Y_{\ell}, X_r, Y_r; c_0, c_1)$  from Definition 57. Let  $x \in X_{\ell}$  and  $y \in Y_{\ell}$  be such that  $A_{\ell}(x, y) \neq 0$ , and let C' be the result of performing a short tableau pivot in C on (x, y). Then  $C' \in \mathcal{C}(X_{\ell}, Y_{\ell}, X_r, Y_r; c_0, c_1)$ .

Proof. Our goal is to show that C' satisfies all properties from Definition 57. Let  $C' = \begin{bmatrix} C'_{11} & C'_{12} \\ C'_{21} & C'_{22} \end{bmatrix}$ , and let  $\begin{bmatrix} A'_{\ell} \\ D' \end{bmatrix}$  be the result of performing a short tableau pivot on (x,y) in  $\begin{bmatrix} A_{\ell} \\ D \end{bmatrix}$ . Observe the following.

- By Lemma 13,  $C'_{11} = A'_{\ell}$ ,  $C'_{12} = 0$ ,  $C'_{21} = D'$ , and  $C'_{22} = A_r$ .
- Since  $\begin{bmatrix} A_\ell \\ D \end{bmatrix}$  is TU by property 3 for C, all entries of  $A_\ell$  are in  $\{0, \pm 1\}$ .
- $A_{\ell}(x,y) \in \{\pm 1\}$ , as  $A_{\ell}(x,y) \in \{0,\pm 1\}$  by the above observation and  $A_{\ell}(x,y) \neq 0$  by the assumption.
- Since  $\begin{bmatrix} A_\ell \\ D \end{bmatrix}$  is TU by property 3 for C, and since pivoting preserves TUness,  $\begin{bmatrix} A'_\ell \\ D' \end{bmatrix}$  is also TU.

These observations immediately imply properties 2 and 3 for C'. Indeed, property 2 holds for C', since  $C'_{22} = A_r$  and  $\begin{bmatrix} c_0 & c_1 & c_0 - c_1 & A_r \end{bmatrix}$  is TU by property 2 for C. On the other hand, property 3 follows from  $C'_{11} = A'_{\ell}$ ,  $C'_{21} = D'$ , and  $\begin{bmatrix} A'_{\ell} \\ D' \end{bmatrix}$  being TU. Thus, it only remains to show that C' satisfies property 1. Let  $j \in Y_r$ . Our goal is to prove that  $D'(X_r, j) \in \{0, \pm c_0, \pm c_1, \pm (c_0 - c_1)\}$ .

property 1. Let  $j \in Y_r$ . Our goal is to prove that  $D'(X_r, j) \in \{0, \pm c_0, \pm c_1, \pm (c_0 - c_1)\}$ . Suppose j = y. By the pivot formula,  $D'(X_r, y) = -\frac{D(X_r, y)}{A_\ell(x, y)}$ . Since  $D(X_r, y) \in \{0, \pm c_0, \pm c_1, \pm (c_0 - c_1)\}$  by property 1 for C and since  $A_\ell(x, y) \in \{\pm 1\}$ , we get  $D'(X_r, y) \in \{0, \pm c_0, \pm c_1, \pm (c_0 - c_1)\}$ .

Now suppose  $j \in Y_{\ell} \setminus \{y\}$ . By the pivot formula,  $D'(X_r, j) = D(X_r, j) - \frac{A_{\ell}(x, j)}{A_{\ell}(x, y)} \cdot D(X_r, y)$ . Here  $D(X_r, j)$ ,  $D(X_r, y) \in \{0, \pm c_0, \pm c_1, \pm (c_0 - c_1)\}$  by property 1 for C, and  $A_{\ell}(x, j) \in \{0, \pm 1\}$  and  $A_{\ell}(x, y) \in \{0, \pm 1\}$ 

 $\{\pm 1\}$  by the prior observations. Perform an exhaustive case distinction on  $D(X_r,j),\,D(X_r,y),\,A_\ell(x,j$ and  $A_{\ell}(x,y)$ . In every case, we can show that either  $\begin{bmatrix} A_{\ell}(x,y) & A_{\ell}(x,j) \\ D(X_r,y) & D(X_r,j) \end{bmatrix}$  contains a submatrix with determinant not in  $\{0,\pm 1\}$ , which contradicts TUness of  $\begin{bmatrix} A_{\ell} \\ D \end{bmatrix}$ , or that  $D'(X_r,j) \in \{0,\pm c_0,\pm c_1,\pm (c_0-c_0)\}$  $c_1$ ), as desired. **Lemma 60.** Let  $C \in \mathcal{C}(X_{\ell}, Y_{\ell}, X_r, Y_r; c_0, c_1)$  from Definition 57. Then C is TU. *Proof.* By Lemma 7, it suffices to show that C is k-PU for every  $k \in \mathbb{N}$ . We prove this claim by induction on k. The base case with k=1 holds, since properties 2 and 3 in Definition 57 imply that  $A_{\ell}$ ,  $A_{r}$ , and D are TU, so all their entries of  $C=\begin{bmatrix}A_{\ell} & 0\\ D & A_{r}\end{bmatrix}$  are in  $\{0,\pm 1\}$ , as desired. Suppose that for some  $k \in \mathbb{N}$  we know that every  $C' \in \mathcal{C}(X_{\ell}, Y_{\ell}, X_r, Y_r; c_0, c_1)$  is k-PU. Our goal is to show that C is (k+1)-PU, i.e., that every  $(k+1) \times (k+1)$  submatrix S of C has det  $V \in \{0, \pm 1\}$ . First, suppose that V has no rows in  $X_{\ell}$ . Then V is a submatrix of  $[D \ A_r]$ , which is TU by property 2 in Definition 57, so det  $V \in \{0, \pm 1\}$ . Thus, we may assume that S contains a row  $x_{\ell} \in X_{\ell}$ . Next, note that without loss of generality we may assume that there exists  $y_{\ell} \in Y_{\ell}$  such that  $V(x_{\ell},y_{\ell})\neq 0$ . Indeed, if  $V(x_{\ell},y)=0$  for all y, then det V=0 and we are done, and  $V(x_{\ell},y)=0$ holds whenever  $y \in Y_r$ . Since C is 1-PU, all entries of V are in  $\{0,\pm 1\}$ , and hence  $V(x_{\ell},y_{\ell}) \in \{\pm 1\}$ . Thus, by Lemma 14, performing a short tableau pivot in V on  $(x_{\ell}, y_{\ell})$  yields a matrix that contains a  $k \times k$  submatrix S''such that  $|\det V| = |\det V''|$ . Since V is a submatrix of C, matrix V'' is a submatrix of the matrix C' resulting from performing a short tableau pivot in C on the same entry  $(x_{\ell}, y_{\ell})$ . By Lemma 59, we have  $C' \in \mathcal{C}(X_{\ell}, Y_{\ell}, X_r, Y_r; c_0, c_1)$ . Thus, by the inductive hypothesis applied to V'' and C', we have  $\det V'' \in \{0, \pm 1\}$ . Since  $|\det V| = |\det V''|$ , we conclude that  $\det V \in \{0, \pm 1\}$ . **Lemma 61.** B'' from Definition 52 is TU. *Proof.* Combine the results of Lemmas 58 and 60. **Theorem 62.** Let M be a 3-sum of regular matroids  $M_{\ell}$  and  $M_{r}$ . Then M is also regular. *Proof.* Let  $B_{\ell}$ ,  $B_r$ , and B be standard  $\mathbb{Z}_2$  representation matrices from Definition 47. Since  $M_{\ell}$  and  $M_r$ are regular, by Lemma 34,  $B_{\ell}$  and  $B_r$  have TU signings. Then the canonical signing B'' from Definition 52

need de tails?

# Conclusion

**Definition 63.** Regular matroid is good. Any 1-sum of good matroids is a good matroid. Any 2-sum of good matroids is a good matroid. Any 3-sum of good matroids is a good matroid.

Corollary 64. Any good matroid is regular. This is the easy direction of the Seymour theorem.

*Proof.* Structural induction.  $\Box$
